

IM Sequencer

Description

Within every FIM solution you have multiple systems that are connected via management agents. A management agent is the connection between a source/destination system (like LDAP, Database, Text files etc.) and Forefront Identity Manager (formerly known as ILM & MIIS). There is out of the box no solution for real time scheduling and triggering management agents based on time or events, reporting or alerting and integrating scripts or applications to complete the synchronization process.

Within every FIM solution you need to schedule the management agents based on a specific interval or events, events like an HR text file is updated or data within the FIM portal is ready to be synchronized. These events can all indicate there is a need to start the synchronization.

Administrators always need to verify the data which is being synchronized and if errors occurred. When errors arise, appropriate counter measures need to be taken to prevent corruption in the IDM system or other connected systems.

Traxion has developed software that help the IDM administrators to get in total control.

The IM sequencer is capable to start any synchronization cycle on a time based scenario, like every hour or every day.

More important the IM Sequencer can start the synchronization cycle based on events that can occur when text files are being updated, or when data within the FIM portal is ready, even if data is ready in Omada Identity manager or other applications can cause the IM sequencer to trigger the run cycle.

This means real time synchronization with FIM!

Every run or step is reported to give administrators insight in which data is being synchronized and which errors occurred, and with the alerting feature administrators only have to act in case of errors and do not have to monitor the system the entire day!

Another important feature is the extensibility, the IM Sequencer uses a plugin model for other developers or companies to integrate other systems (event based), execute custom steps to complete your synchronization work or use custom conditions to block synchronization in very specific circumstances.

The next important feature is configurable thresholds, these thresholds block synchronization if a huge amounts of data are being added, changed or deleted.

You can read more and download and try out our software now, just go to:

Features

Compact feature list:

- Copy, rename and move file(s)
- Execute processes and scripts
- Execute SQL or PowerShell commands
- Upload/Download FTP(S) files
- Execute management agents
- Manage run and password history
- FIM 2010 & Omada workflow
- Time based synchronization
- Event based synchronization (FIM, Omada, AD, SQL, PowerShell)
- Plugin based synchronization
- Advanced & Intuitive reporting
- Thresholds
- Highly customizable
- Step behaviors

Traxion is an organization specialized in Identity & Access management. Traxion is a Independent vendor that can provide it's clients with a complete Identity & Access management portfolio.

Traxion has a excellent track record which is unique in the market.

The **IM Sequencer** delivers more control for managing the Identity Management solution it provides important information from the system and replaces any custom
